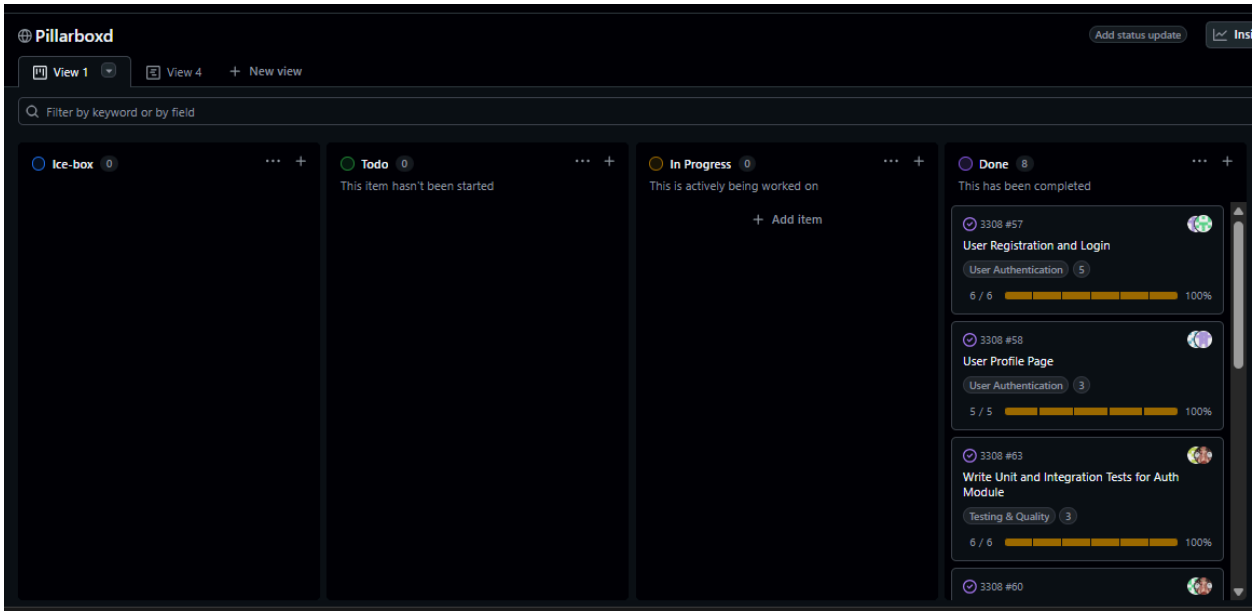
Pillarboxd

Names: Ahmed Alrubeh, Alexandra Ivanova, Melody Kuoch, Cameron Malinis, Max Malkin, Kordell Schneider

Our application is a cross-platform TV show tracking and discovery tool designed to help users organize, analyze, and discover television content across multiple streaming services. While existing platforms like Letterboxd focus primarily on movies and most streaming platforms only track viewing activity within their own ecosystems, our application bridges these gaps by allowing users to track their progress on TV shows regardless of where they are streaming them.

A large functionality of our application centers around recommendations filtered by the streaming services the user is subscribed to. We focus on two primary buckets to provide these recommendations: user activity and rating systems. Users will be able to mark episodes as watched, keep track of where they left off in a series, and view their watch history in one centralized location, eliminating the need to manually remember progress across multiple platforms. By incorporating a user's past reviews and their available streaming platforms, the system can suggest shows that are both relevant to their tastes and accessible to them immediately. This makes the application not only a tracking tool but also a discovery engine that helps users find new shows to watch without needing to search through multiple streaming services individually.



For our project board, we had placed large tasks/issues on the board with each one having numerous subtasks/subissues. (https://github.com/users/maxmalkin/projects/3/views/1)

Team Contributions:

Ahmed Alrubeh:

I was the notifications engineer for this project. I Built the Discord webhook notifications tied into CI/CD that Auto-alerted the team when builds or tests failed on any branch.

Alexandra Ivanova:

I was the front end engineer. I built the UI and visual experience of the app including the home, search, watchlist, and recommendations pages.

Melody Kuoch:

My role was API integration engineer. I primarily worked on connecting api routes from the front end and backend. I also worked on a lot of the early wireframes on figma alongside Alex. I also built the outline for our presentation.

Cameron Malinis:

I was the database engineer for this project. I Designed and implemented the database schema and Built the functionality behind the login and registration.

Max Malkin:

I worked as a full stack lead which included: Architecting the core backend and server skeleton, Establishing the technical foundation the rest of the team built on, and lastly setting up the CI/CD pipeline. I have the most technical experience of the team, so my main goal was allocating roles to the others and supporting where needed.

Kordell Schneider:

Because I had a lot of technical issues developing any actual code for the project, I had to take on more of a project manager role while I was working on resolving issues with my machine. I helped the team's organization through being the primary notetaker, maintaining release notes, managing the project board, tracking user stories, and ensuring weekly deliverables got to Zach. During the last lab Zach and I agreed to give up on

trying to resolve issues with my machine that prevented me from directly working with my team's repo, and I worked a bit more on UI.

Deployment:

The live app is at https://pillarboxd.malkin.io. It was deployed on Render as a Blueprint using a *render.yaml* file to define the services that needed to be created. To access the deployed version, visit the URL. To run locally, follow the instructions in the repo's root README.
